PROJECT
PROGRESS REPORT 1

Student Name: Oke Ebiyomare **Student ID:** 300392124

Course Code: CSIS 4495 **Course Name:** Applied Research Project

TABLE OF CONTENTS

1. Work Logs ..... Page 3
2. Summary Description of Work Done ..... Page 3
3. Repo Check-in of Implementation Completed ..... Page 3
4. AI Use Section ..... Page 3
   4.1 Table of AI Tools and Specific Use ..... Page 3
5. Appendix: Prompt History ..... Page 4

1. WORK LOGS

Table of Work Logs

Date	Number of Hours	Description of work done
October 3, 2026	3	Research with Dapo to find appropriate data to use to train the Machine Learning model. We discovered the CIC-ID2017 dataset from the Canadian Institute for Cybersecurity. It contains logs from 5 days (Monday to Friday). It covers different attack types like DDoS, Brute Force, Web Attacks, Botnet, and Infiltration.
October 7, 2026	2	Refactor GitHub repo structure to match specifications of the project and to reflect the actual work we would be doing and the various service we would have to develop.
October 9, 2026	5	Initialized the Next.js application within the web-frontend directory. I built out the dashboard homepage and used dummy data to simulate real metrics.

2. DESCRIPTION OF WORK DONE

During this period, I collaboration with Dapo, we were able to find Canadian Institute for Cybersecurity's CIC-IDS2017 dataset, which would be used to train the ML model. It covers 5 days of traffic and it contains 5 types of attack traffic (DDoS, Brute Force, Web Attacks, Botnet, and Infiltration). I refactored the GitHub repository structure to reflect our microservices workflow and initialized the Next.js application in web-frontend(Implementations/apps/web-frontend). I also built out the initial dashboard homepage with dummy metrics.

3. IMPLEMENTATION COMPLETED

The files/folders I have checked in the repo are as follows:
Implementation/app/web-frontend: The Next.js application uses TypeScript for strict type safety and robust component architecture, Tailwind CSS for responsive, utility-first styling, and shadcn/ui components for a sleek and uniform dashboard interface. The checked-in codebase includes the initial App Router setup, layout configurations, and component modules designed to simulate real-time network security metrics and threat-monitoring feeds for the AI-driven platform.

4. AI USE SECTION

Table of AI Tools and Specific Use

AI Tool Name	Version, Account Type	Specific feature for which the AI tool was used	Value Addition What value did you add over and above what AI did for you? In your own words
Google Gemini	Free	Deciding the react framework to use, CSS framework and component library to use	While Ai provided a comparison of framework options, I analyzed the project needs, choose Next,js(TypeScript), Tailwind CSS and shadcn/ui based on the technical experience of the team and the amount of support each tool has.
